## Question 1

Q: How would you show a property  $P(r)$  holds for all regular expressions  $r$ , by structural induction?

A:

- As a basis, show  $P(r)$  holds for all terminal cases, i.e.  $\mathbf{rBase} ::= 0 \mid 1 \mid c$ .
- Let  $r_1$  and  $r_2$  be regexes, and suppose  $P(r_1)$  and  $P(r_2)$  hold [This is the inductive hypothesis, IH].
- Induction over the remaining cases (which are inductively defined) to show property holds on by applying IH:  
 $\mathbf{rInd} ::= r_1+r_2 \mid r_1.r_2 \mid r^*$ .
- Thus all cases are covered, which is sufficient to prove a property by structural induction.

## Question 2

Q: Define a regular expression,  $ALL$ , that can match every string.

Write this in terms of  $\mathbf{r} ::= 0 \mid 1 \mid c \mid r_1+r_2 \mid r_1.r_2 \mid r^* \mid r$

A:  $ALL = \sim(0)$

## Question 3

Q: Define the expressions  $r^+$ ,  $r^?$ ,  $r^{\{n\}}$ ,  $r^{\{m,n\}}$  in terms of basic regular expressions.

A:

- $r^+ = r . r^*$
- $r^? = 1 + r$
- $r^{\{n\}} = r_1 . r_2 . \dots . r_n$
- $r^{\{m,n\}} = (r_1 . r_2 . \dots . r_m) . ( 1 + (r_{m+1}) + (r_{m+1} . r_{m+2}) + (r_{m+1} . \dots . r_n) )$
- (where  $r_i = r$  for all  $i$ )

## Question 4

Q: Given the regular expressions for lexing a language with identifiers, parenths, numbers (postive/negative), and operators  $+$ ,  $-$ ,  $*$ :

A:

```
DIGIT      = RANGE("0123456789")
START_DIGIT = RANGE("123456789")
NUMBER     = OPT(CHAR('-')) . (DIGIT + (START_DIGIT . DIGIT*))
           [Numbers are implicitly positive, or explicitly negative]
```

```
LPAREN     = CHAR('(')
RPAREN     = CHAR(')')
```

```
OPERATOR   = CHAR('+') + CHAR('-') + CHAR('*')
```

```
LOWERCASE  = RANGE("abcdefghijklmnopqrstuvwxyz")
ID         = LOWERCASE . LOWERCASE*
```

```
LANG       = ("num":NUMBER) + ("op":OPERATOR) + ("lp":LPAREN)
           + ("rp":RPAREN) + ("id":ID)
```

- $(a3+3)*b = \text{YES}$ ,  $\text{lp}:($ ,  $\text{id}:a$ ,  $\text{op}:+$ ,  $\text{num}:3$ ,  $\text{rparen}:)$ ,  $\text{op}:*$ ,  $\text{id}:b$
- $()++-33 = \text{YES}$ ,  $\text{rp}:)$ ,  $\text{lp}:($ ,  $\text{rp}:)$ ,  $\text{op}:+$ ,  $\text{op}:+$ ,  $\text{num}:-33$
- $(b42/3)*3 = \text{NO}$ ,  $/$  is not an accepted token.

## Question 5

Q: Suppose the context-free grammar  $G$ :

```
S ::= A.S.B | B.S.A | ε
A ::= a | ε
B ::= b
```

where the starting symbol is  $S$ , which of the following are in the language of  $G$ ?:

A:

- $a$  - No,  $a$  must be followed by  $b$
- $ba$  - Yes
- $b$  - Yes
- $bb$  - Yes ( $B . (B . S . A) . A$ )
- $ab$  - Yes
- $baa$  - No,  $a$  must be followed by  $b$

## Question 6

Q: Suppose the context-free grammar  $S ::= a.S.a \mid b.S.b \mid \epsilon$   
Describe the language generated by this grammar.

A: All even-length palindromes over the alphabet  $\{a,b\}$ .

## Question 7 (Optional)

Q: Prove by induction on  $r$  that the property  $L(\text{der } c \ r) = \text{Der } c \ (L(r))$  holds.

A:  $\text{Der}(c, A) \equiv \{s \mid c :: s \in A\}$ , i.e. the derivate of language  $A$  w.r.t character  $c$  is the language of all strings in  $A$  beginning with  $c$ , with the  $c$  ‘chopped off’ the front.

Basis:

- $R = 0$ :  $\text{der}(c, R) = 0$  and  $L(0) = \{\}$ .  $\text{Der}(c, \{\}) = \{\}$  so holds.
- $R = 1$ :  $\text{der}(c, R) = 0$ ,  $L(0)$  as above, so holds.
- $R = c_1$ :  $\text{der}(c, c_1) = 1$  if  $c = c_1$  else  $0$ .  
 $L(1) = \{\epsilon\}$  and  $L(0) = \{\}$ .  
 $\text{Der}(c, \{c\}) = \{\epsilon\}$  and  $\text{Der}(c, \{d\}) = \{\}$  so holds.

Inductive Hypothesis:

Assume some expressions  $r_1, r_2$  such that  $L(\text{der}(c, r_i)) \equiv \text{Der}(c, L(r_i))$  holds for  $i = 1, 2$ . Show true for remaining regex cases.

Inductive Proof:

- $R = r_1 + r_2$   
The language accepted by  $r_1 + r_2$  is  $L(r_1) \cup L(r_2)$ .  
The language accepted by  $\text{der}(c, r_1 + r_2)$  is  $L(\text{der}(c, r_1)) \cup L(\text{der}(c, r_2))$ .  
Since by IH  $L(\text{der}(c, r_i)) \equiv \text{Der}(c, L(r_i))$  holds,  
 $\text{Der}(c, L(r_1 + r_2)) = L(\text{der}(c, r_1)) \cup L(\text{der}(c, r_2)) = L(\text{der}(c, r_1 + r_2))$  also holds.
- $R = r_1 \cdot r_2$   
The language accepted by  $r_1 \cdot r_2$  is  $L(r_1) @ L(r_2)$ .  
The language accepted by  $\text{der}(c, r_1 \cdot r_2)$  is  
 $L(((\text{der}(c, r_1)).r_2) + \text{der}(c, r_2))$  if  $\epsilon \in L(r_1)$ , else  $L((\text{der}(c, r_1)).r_2)$ .

The second case is equivalent to  $L(\text{der}(c, r_1)) @ L(r_2)$  and the first case is equivalent to  $(L(\text{der}(c, r_1)) @ L(r_2)) \cup L(\text{der}(c, r_2))$

Since by IH  $L(\text{der}(c, r_i)) \equiv \text{Der}(c, L(r_i))$  holds,

when  $\epsilon \in L(r_1)$ :

$\text{Der}(c, L(r_1 \cdot r_2)) = (L(\text{der}(c, r_1)) @ L(\text{der}(c, r_2))) \cup L(\text{der}(c, r_2)) = L(\text{der}(c, r_1 + r_2))$   
also holds, as does  $\text{Der}(c, L(r_1 \cdot r_2)) = L(\text{der}(c, r_1)) @ L(\text{der}(c, r_2)) = L(\text{der}(c, r_1 + r_2))$  otherwise.

- $R = r_1^*$   
 $D = \text{der}(c, R) = \text{der}(c, r_1^*) \cdot r^*$   
 $L(D) = L(\text{der}(c, r_1)) \cup L(R)$   
 $\text{Der}(c, L(r_1^*)) = \text{Der}(c, L(r_1)) \cup L(r_1^*) = L(D)$   
Holds, by all previous cases as  $r_i$  can only be of the forms:  
 $r := 0|1|c|r_1 + r_2|r_1 \cdot r_2|r^*$ .
